## CCV preparations

CCV-enriched fractions were prepared essentially as described by Hirst et al. (2004). In brief, four to six confluent dishes ( $500 \mathrm{~cm}^{2}$ ) of HeLa cells were scraped into buffer A ( 0.1 M MES, pH $6.5,0.2 \mathrm{mM}$ EGTA, $0.5 \mathrm{mM} \mathrm{MgCl}_{2}$, and $0.02 \% \mathrm{NaN}_{3}$ ) supplemented with 0.2 mM AEBSF. Cells were homogenized with a motorized Dounce homogenizer ( 20 strokes), and centrifuged at $4,147 \mathrm{~g}$ for 32 min . Supernatants were treated with ribonuclease A at $50 \mu \mathrm{~g} / \mathrm{ml}$ for 60 min . Membranes were pelleted by centrifugation at $135,750 \mathrm{~g}$ for $30-45 \mathrm{~min}$. Membranes were resuspended in buffer A and mixed with an equal volume of $12.5 \%$ Ficoll/12.5\% sucrose in buffer A. Samples were spun at $21,720 \mathrm{~g}$ for 34 min to pellet most of the contaminating membranes. Supernatants were diluted with four volumes of buffer A, and CCV-enriched fractions were pelleted by centrifugation at $135,750 \mathrm{~g}$ for $30-45 \mathrm{~min}$. All preparations were performed at $4^{\circ} \mathrm{C}$. Mock CCV fractions were prepared likewise, but from 8 to 12 confluent dishes $(15 \mathrm{~cm})$ of HeLa cells that had been treated with siRNA against clathrin heavy chain.

## 1D and 2ロ gels

SDS-PAGE and Western blots were performed according to standard protocols. The antibodies used in this study are listed in Table S3. For analysis by 2D gel electrophoresis, CCV-enriched fractions were resuspended in $2.5 \% \mathrm{SDS} / 50 \mathrm{mM}$ Tris, pH 8.0 , heated to $65^{\circ} \mathrm{C}$ for 2 min , and spun at $16,000 \mathrm{~g}$ for 2 min . Proteins were precipitated from supernatants with 5 volumes of acetone at $-20^{\circ} \mathrm{C}$ for a minimum of 16 h and resuspended in AUT sample buffer ( 10 mM Tris- $\mathrm{HCl}, \mathrm{pH} 8.5,7 \mathrm{M}$ urea, 2 M thiourea, $2 \%$ ASB14, and $0.5 \%$ Triton X-100) at room temperature. Samples were labeled with CyDyes Cy3 and Cy5 as described by Borner et al. (2003). All labeling reactions were performed in reciprocal duplicate. Fluorescent 2D DIGE was performed as in Borner et al. (2003), based on the method first published by Unlu et al. (1997). Nonlinear IPG-strips (pH 3-10) were used for the first dimension and $10 \%$ polyacrylamide gels for the second dimension.

Mass spectrometry
Proteins excised from 1D gels
Identification of proteins was achieved by the standard techniques of in-gel trypsin digestion and peptide mass fingerprinting and fragmentation. Gel bands were excised and digested with trypsin according to the method of Shevchenko et al. (1996). Samples of tryptic peptide mixtures were mixed with $\alpha$-cyano-4-hydroxy-transcinnamic acid matrix and analyzed with a MicroMass ToFSpec2E or an ABI 4700 proteomics analyzer with TOFTOF optics. For peptide mass fingerprints, mass calibration was performed with features internal to the spectrum, specifically the matrix-related ion peak at $1,060.048 \mathrm{D}$ and the trypsin autolysis peaks at $2,163.057$ and $2,273.160$ D. For peptide fragment spectra, an "external" mass calibration was generated from the 2,163.057-D tryp$\sin$ autolysis peak, using the $\mathrm{y} 10, \mathrm{y} 14$, and y 16 fragment ions. Spectra were interpreted by the Mascot sequence database search engine configured with a mass tolerance of 40 ppm and the gel-derived variable modifications "propionamide cysteine" and "methionine sulfoxide" against the National Center for Biotechnology Information (NCBI) database. Probability-based MASCOT scores were used to evaluate identifications. Only matches with $\mathrm{P}<0.05$ for random occurrence were considered significant (further explanation of Mascot scores can be found at http://www.matrixscience.com).

## Proteins excised from 2D gels

Proteins within the gel pieces were first reduced, carboxyamidomethylated, and digested to peptides using trypsin on a MassPrepStation (Waters). The resulting peptides were applied to a liquid-chromatography tandem mass spectrometer. The reverse-phase liquid chromatographic separation of peptides was achieved with a PepMap C18 reverse phase, 75 mm i.d., $15-\mathrm{cm}$ column (LC Packings) on a capillary LC system (Waters) attached to a QTof2 (Waters) mass spectrometer or the same column attached to a Dionex Dual Gradient LC system attached to a QSTAR XL (Applied Biosystems). The MS/MS fragmentation data achieved was used to search the NCBI database using the MASCOT search engine. Probability-based MASCOT scores were used to evaluate identifications. Only matches with $\mathrm{P}<0.05$ for random occurrence were considered significant.

## iTRAQ analysis

## Sample preparation, labeling, and fractionation

For analysis by iTRAQ (Ross et al., 2004), control and mock CCV preps were resuspended in $2.5 \% \mathrm{SDS} / 50 \mathrm{mM}$ Tris, pH 8.0 , heated to $65^{\circ} \mathrm{C}$ for 2 min and spun at $16,000 \mathrm{~g}$ for 2 min . Proteins were precipitated from supernatants with 5 volumes of acetone at $-20^{\circ} \mathrm{C}$ for a minimum of 16 h . Precipitates were solubilized in $\sim 100 \mu \mathrm{l}$ labeling buffer ( 25 mM triethylammonium bicarbonate [TEAB], pH 8.5, 8 M Urea, $2 \%$ Triton X-100, and $0.1 \%$ SDS). Protein concentrations were determined using the BCA Protein Assay kit (Pierce Chemical Co.). Samples were adjusted to the same protein concentration with labeling buffer and split into two equal aliquots to ob-
tain two pairs of mock and control CCVs (technical replicates). Samples ( $\sim 70 \mu \mathrm{~g}$ of protein) were reduced ( 4 mM Tris[2carboxyethyl]phosphine, $20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) and cysteines blocked ( 8 mM methyl methanethiosulfonate, $20^{\circ} \mathrm{C}, 10 \mathrm{~min}$ ). Samples were diluted with 50 mM TEAB, pH 8.5 , such that the urea concentration was $<1 \mathrm{M}$, digested with trypsin overnight at $37^{\circ} \mathrm{C}$ ( $5 \mu \mathrm{~g}$; Promega), and lyophilized. Samples were resuspended in $100 \mu \mathrm{l} 0.25 \mathrm{MTEAB}, \mathrm{pH} 8.5,75 \%$ ethanol, added to one unit of the corresponding iTRAQ reagent and incubated for 1 h at $20^{\circ} \mathrm{C}$. A four-plex iTRAQ labeling (Applied Biosystems) was performed as follows: mock CCVs technical repeat 1 labeled with iTRAQ reagent 114 ; mock CCVs technical repeat 2 with 115 ; control CCVs technical repeat 1 with 116 ; control CCVs technical repeat 2 with 117 . Residual reagents were hydrolyzed with $100 \mu l$ water ( $20^{\circ} \mathrm{C}, 15 \mathrm{~min}$ ). The labeled peptides were then pooled, lyophilized, and resuspended in $3 \mathrm{ml} 20 \% \mathrm{vol} / \mathrm{vol}$ acetonitrile, $10 \mathrm{mM} \mathrm{KH} \mathrm{KO}_{4} / \mathrm{H}_{3} \mathrm{PO}_{4}$, pH 2.7 . Peptides were fractionation by cation-exchange chromatography on a BioLC HPLC system (Dionex) using a PolySulfoethyl A column (PolyLC; $2.1 \times 200 \mathrm{~mm}, 5 \mu \mathrm{~m}, 300 \AA$ ). Samples were loaded onto the column and washed for 60 min at $200 \mu \mathrm{l} / \mathrm{min}$. Peptides were eluted using a $70-\mathrm{min}$ linear gradient of $30-125 \mathrm{mM} \mathrm{KCl}\left(20 \% \mathrm{vol} / \mathrm{vol}\right.$ acetonitrile and $\left.10 \mathrm{mM} \mathrm{KH} \mathrm{KO}_{4} / \mathrm{H}_{3} \mathrm{PO}_{4}, \mathrm{pH} 2.7\right)$ at 200 $\mu \mathrm{l} / \mathrm{min}$. Fractions were collected at 2-min intervals, lyophilized, and resuspended in $140 \mu \mathrm{l} 2 \%$ acetonitrile and $0.1 \%$ trifluoroacetic acid.

Samples were analyzed by LC-MS/MS. The reverse-phase liquid chromatographic separation of peptides was achieved with a PepMap C18 reverse phase, 75 mm i.d., $15-\mathrm{cm}$ column (LC Packings) on a capillary LC system (Waters) attached to a Dionex Dual Gradient LC system attached to a QSTAR XL (Applied Biosystems). The obtained MS/MS fragmentation data were used to search the NCBI database using the MASCOT search engine. Probability-based MASCOT scores were used to evaluate identifications. Only matches with $\mathrm{P}<0.05$ for random occurrence were considered significant (further explanation of MASCOT scores can be found at http://www.matrixscience.com).

## Generation of a nonredundant protein database

An important feature of the iTRACKER software (Shadforth et al., 2005) used for the quantitation of iTRAQ-labeled peptides is that it only processes peptides that are unique in the protein database. This ensures that the peptides are assigned unambiguously to parent proteins and that the observed quantitation refers to only one protein. This rigorous approach absolutely requires a nonredundant protein database, as multiple entries for the same protein (partial sequences, splice variants, etc.) will lead to the exclusion of the corresponding peptides. However, all currently available public databases are partially redundant; trial analysis of our iTRAQ data with the UniProt and Ensembl databases was unsatisfactory, as many identified proteins were not quantified (unpublished data). We therefore created our own protein database specifically for the iTRAQ analysis.

Proteins that had been identified in the iTRAQ-labeled samples by LC-MS/MS and the MASCOT search engine were compiled into a nonredundant list. Only proteins that fulfilled the following requirements were included: (1) a MASCOT score $>36$ (i.e., $\mathrm{P}<$ 0.05 for random match) and (2) at least one unique peptide with a MASCOT score $\geq 20$. Protein sequences were downloaded from the NCBI protein database (http://www.ncbi.nlm.nih.gov). In cases of redundant entries for the same protein, a representative sequence was chosen. With these criteria, a list of 903 proteins in FastA format was assembled. This list was called CP database (CCV Protein database) and used for iTRAQ quantitation.

MS data analysis and protein quantitation
MS data files were processed using the wiff2DTA software, which converts QSTAR data files (.wiff) into text files that contain $\mathrm{m} / \mathrm{z}$ and intensity information (peak lists) for each product ion spectra (Boehm et al., 2004). Each MS data file was processed twice in order to generate centroided peak lists, which contain a single $\mathrm{m} / \mathrm{z}$ value for each ion corresponding to the center of the peak, and uncentroided peak lists, which contain $\mathrm{m} / \mathrm{z}$ information for the entire peak. Mascot version 2.0.01 (Matrix Science), was used to search centroided peak lists against the CP database. The following modifications were used: fixed, iTRAQ (K), iTRAQ (N-term), MMTS (C), variable, oxidation (M), and iTRAQ (Y). The MS tolerance was 0.2 D and the MSMS tolerance 0.5 D . The Mascot search results comprise a list of peptide identifications, each of which has a score that indicates the quality of the result. To determine the minimum peptide Mascot score for accurate protein identification, each peak list was searched against a version of the CP database in which the protein sequences were reversed. The identifications that resulted from the reversed database search were used to calculate the false protein identification rate: false protein identification rate $=$ number of proteins identified from the reversed search/number of proteins identified from the normal search $\times 100$. Mascot peptide scores of at least 25 for proteins identified with two or more matched peptides and scores of at least 44 for identifications based on single peptides resulted in false protein identification rates of $<1 \%$. Normalized iTRAQ reporter ion ratios were calculated from the uncentroided peak lists using the recently developed i-Tracker software (Shadforth et al., 2005). Normalized reporter ion areas were calculated as follows: normalized area $\mathrm{A}=\operatorname{area} \mathrm{A} /(\operatorname{area} \mathrm{A}+$ area $B+\operatorname{area} C+\operatorname{area} D$ ). The Genome Annotating Proteome Pipeline (GAPP) system (www.ccbit.org/gapp) was used to parse peptide identification and scoring information from the Mascot output files and link these to the quantitation data in a relational database (MySQL version 4.0, MySQL AB). Peptides were quantified if at least three of the reporter ion peaks were above a threshold of 10 counts and if they had a Mascot score of at least 20. In addition, only peptides that were unique to a single identified protein were quantified.

Averaged normalized areas were used to calculate the relative abundance of proteins in control and mock CCVs, which was expressed as an average ratio [con/mock], using the following formula: $\left(\left[\mathrm{A}_{116} / \mathrm{A}_{114}\right]+\left[\mathrm{A}_{116} / \mathrm{A}_{115}\right]+\left[\mathrm{A}_{117} / \mathrm{A}_{114}\right]+\left[\mathrm{A}_{117} / \mathrm{A}_{115}\right]\right) / 4$. ( $\mathrm{A}_{116}$ and $\mathrm{A}_{117}$ correspond to control CCVs and $\mathrm{A}_{114}$ and $\mathrm{A}_{115}$ to mock CCVs.) Proteins were ranked according to ratios. Ratios were
normalized by division by 2.5 , to obtain a ratio of $\sim 1$ for the center point of the distribution (protein no. 261). These normalized ratios were used for the plot (ratio over rank) as shown in Fig. 3.

An inherent difficulty of iTRAQ is the nontrivial data analysis, as well as the considerable processing time required for the mass-spectrometric analysis. Hence, the iTRAQ data discussed in this study was derived from a single pair of control and mock CCV fractions, analyzed in duplicate. However, this particular pair of CCVs was probed by Western blot for $>20$ different marker proteins, including CCV and non-CCV proteins. All of them showed enrichment or depletion as expected (unpublished data). This as well as the consistency with the DIGE and Western blot data make it very likely that the iTRAQ data presented here are highly representative.

Control and mock CCV fractions were prepared as in Fig. 1 and analyzed by iTRAQ in conjunction with LC-MS/MS (Fig. 3). Identified proteins were ranked based on their relative abundance in mock and control CCVs; a high rank corresponds to a high ratio of control/mock CCVs and, thus, to candidate CCV proteins. The Mascot score reflects the confidence with which a protein was identified; a score $>36$ indicates $>95 \%$ confidence of dentification. "Peptides quantified" indicates how many iTRAQ-labeled peptides were used for the quantitation. The control/mock ratio
corresponds to the relative abundance of a protein in control and mock CCVs; the ratio is the average of two technical replicates. Likely false positives among high ranking proteins are in italics. Proteins that were identified in CCV preparations by Blondeau et al. (2004) or Girard et al 2005) but are $<50 \%$ depleted from mock CCVs (and thus not predicted to be genuine CCV proteins) are in bold. Please note that ratios $<1$ indicate roteins that are enriched in the mock CCVs relative to the control CCVs, suggesting that either their expression is increased or their subcellular ocalization is changed by clathrin heavy chain knockdown

Table S2. Summary of CCV proteins identified in this study by different methods

This table lists all CCV proteins identified in this study. Only proteins that showed clear depletion from mock CCVs by one or more techniques are listed. Four different methods were used to compare control and mock CCVs: 1D-PAGE, 2D-DIGE, Western blotting, and iTRAQ. In the corresponding columns, a plus sign indicates that a protein was identified and depleted from mock CCVs (bona fide CCV protein). $+/=$ indicates that a protein was identified, but only a moderate level of depletion from mock CCVs was observed. ND indicates that a protein was not detected. Proteins whose association with CCVs had previously not been established are annotated as new.

Table S3. List of antibodies

| Antibody against | Host | Mono/polyclonal | Name/source |
| :---: | :---: | :---: | :---: |
| Primary antibodies |  |  |  |
| AP-1 $\beta 1$ | Rabbit | P | Page et al., 1995 |
| AP-1 $\gamma$ | Rabbit | P | Seaman et al., 1996 |
| AP-2 $\alpha$ | Rabbit | P | Ball et al., 1995 |

| AP-3 $\mu 3$ | Rabbit | P | Simpson et al., 1996 |
| AP-4 $\beta 4$ | Rabbit | P | Hirst et al., 1999 |
| CI Mannose-6phoshate receptor | Rabbit | P | 1001/gift from P. Luzio, Cambridge Institute for Medical Research, University of Cambridge, UK |
| Clathrin heavy chain | Rabbit | P | Simpson et al., 1996 |
| Elongation factor 2 | Goat | P | C-14/Santa Cruz Biotechnology, Inc. |
| EpsinR | Rabbit | P | Hirst et al., 2003 |
| Pallidin | Mouse | M | Nazarian et al., 2006 |
| Sec 22 | Rabbit | P | Hay et al., 1997 |
| SNAP 23 | Rabbit | P | Synaptic Systems |
| SNAP 29 | Rabbit | P | Synaptic Systems |
| Sorting nexin 1 | Rabbit | P | Seaman, 2004 |
| Syntaxin 2 | Rabbit | P | Calbiochem |
| Syntaxin 3 | Rabbit | P | Calbiochem |
| Syntaxin 4 | Mouse | M | Transduction Laboratories |
| Syntaxin 6 | Rabbit | P | Gift from A. Peden, Genentech, Inc., South San Francisco, CA |
| Syntaxin 7 | Rabbit | P | Gift from A. Peden |
| Syntaxin 8 | Mouse | M | BD Biosciences |
| Syntaxin 16 | Mouse | M | Gift from A. Peden |
| Syntaxin 17 | Goat | P | Steegmaier et al., 2000 |
| Transferrin receptor | Mouse | P | Zymed |
| VAMP3 | Rabbit | P | Abcam |
| VAMP4 | Hamster | P | Steegmaier et al., 1999 |
| VAMP7 | Mouse | M | Advani et al., 1999 |
| VPS26 | Rabbit | P | Seaman, 2004 |
| Vtila | Mouse | M | BD Biosciences |
| Vtilb | Mouse | M | BD Biosciences |
| Secondary antibodies |  |  |  |
| Anti-goat HRP | Rabbit | P | Sigma-Aldrich |
| Anti-Hamster HRP | Goat | P | Jackson ImmunoResearch Laboratories |
| Anti-mouse HRP | Rabbit | P | Sigma-Aldrich |
| Anti-rabbit HRP | Goat | P | Sigma-Aldrich |
