Moore et al., <http://www.jcb.org/cgi/content/full/jcb.201006092/DC1>

Figure S1. Localization of Sak1 and Tos3. (A) Localization of Sak1. Tandem RFP/tdimer2 was fused to the carboxy terminus of Sak1 by integration at the endogenous *SAK1* locus. Cells also express GFP-Tub1. Strain: yJC7003. (B) Localization of Tos3. Monomeric YFP/mCitrine was fused to the carboxy terminus of Tos3 by integration at the endogenous *TOS3* locus. Cells also express CFP-Tub1. Dashed lines indicate unbudded cells, and solid lines indicate budded cells. Strain: yJC7073. Bars, 2 μ m.

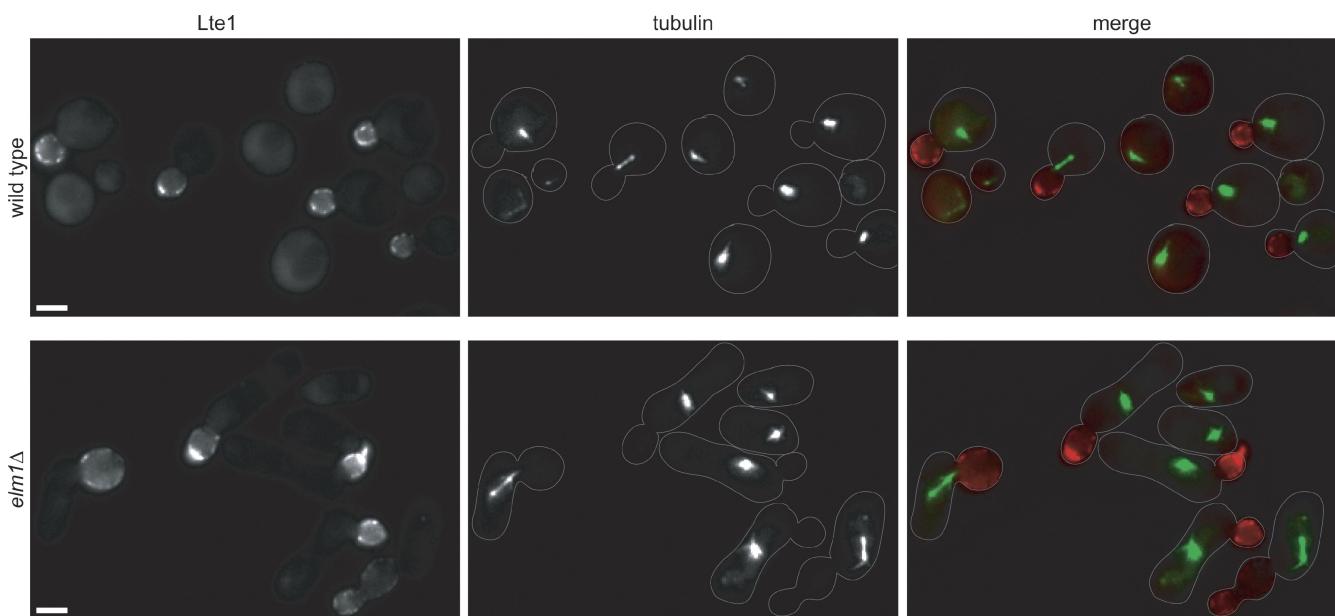

Figure S2. Lte1 localization in *elm1* Δ mutants. Three copies of GFP were fused to the carboxy terminus of Lte1 by integration at the endogenous locus (Castillon et al., 2003) and crossed into wild-type or *elm1* Δ mutant cells expressing microtubules labeled with mCherry-Tub1 (plasmid pAK011). Images were collected using a wide-field microscope. Solid lines indicate outlines of cells. Strains: wild type, yJC6390 and *elm1* Δ , yJC6389. Bars, 2 μ m.

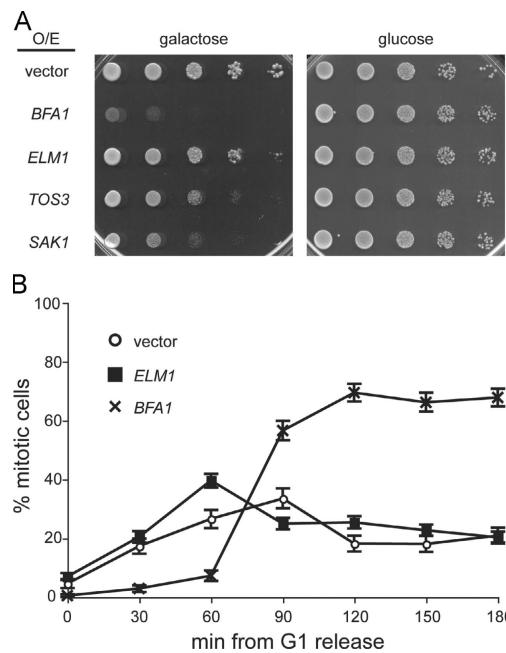

Figure S3. *ELM1* overexpression does not inhibit mitotic exit. (A) Growth assay on plates. High-copy plasmids containing *BFA1*, *ELM1*, *TOS3*, or *SAK1* under the control of a galactose-inducible promoter were transformed into a wild-type strain background, and a 10-fold dilution series was spotted onto media selective for plasmid retention and containing either galactose to induce expression or glucose to inhibit expression (see Materials and methods). O/E, overexpression. (B) Cell cycle analysis. Strains used in A were arrested with α factor and released into new media containing galactose to induce expression of plasmid-borne genes (see Materials and methods). After release, samples were collected at 30-min intervals and fixed, and the proportions of cells containing anaphase-length spindles were determined. Error bars are the standard error of proportion. Strain: yJC3677. Plasmids: pGAL-BFA1, pBJ1652; pGAL-ELM1, pBJ1695; pGAL-TOS3, pBJ1649; pGAL-SAK1, pBJ1650; and vector, pBJ216.

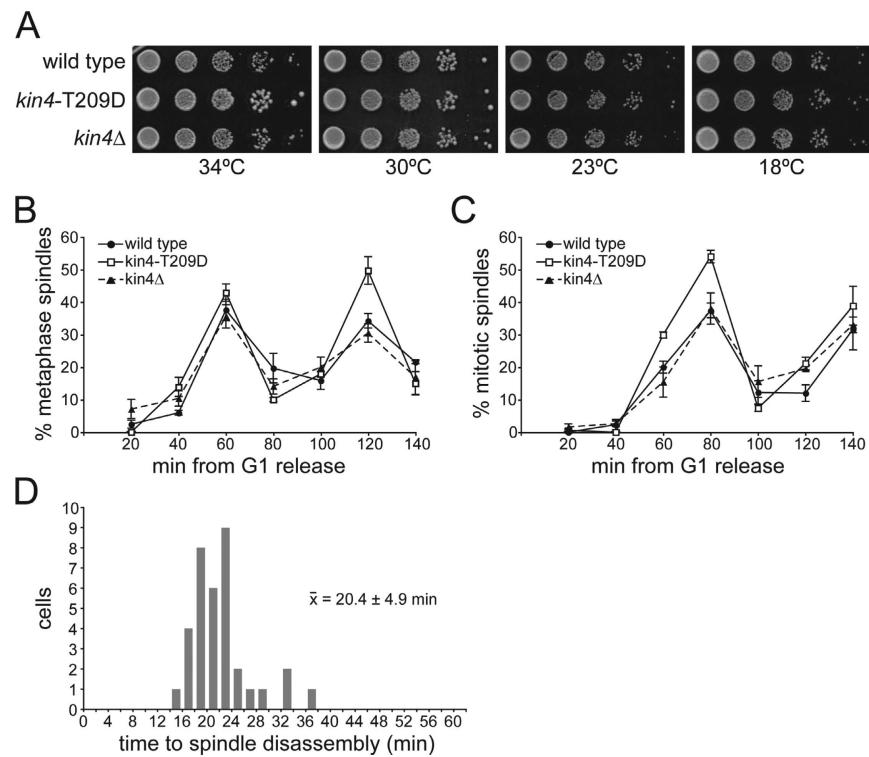

Figure S4. Phosphomimetic Kin4-T209D is not sufficient to prolong mitosis. Strains: wild type, yJC5920; *kin4*-T209D, yJC7084; and *kin4* Δ , yJC7805. (A) Growth assay on plates. Wild type, *kin4*-T209D, and *kin4* Δ strains were grown to saturation in rich media and diluted 1:4, cell number was normalized by OD₆₀₀, and a 10-fold dilution series was spotted onto rich media. Cells were allowed to grow for 2 d at 34°C, 30°C, and 23°C or for 7 d at 18°C. (B and C) Cell cycle analysis. Strains used in A were arrested with α factor and released into new media. After release, samples were collected at 20-min intervals and fixed, and the numbers of cells containing metaphase-length spindles (≤ 2 μ m; B) or anaphase-length spindles (> 2 μ m; C) were determined based on GFP-labeled microtubules. These are depicted as a percentage of total cells. Values are the means of three counts of at least 50 cells. Error bars are the standard error of the means. (D) Timing of spindle disassembly after one SPB moves into the bud from videos of GFP-tubulin collected on a confocal microscope. Strain: *kin4*-T209D *dyn1* Δ , yJC7080, $n = 35$.

Table S1. Strains and plasmids used in this study
