Cover picture: Confocal image of myelinating oligodendrocyte in developing rat brain immunostained with an antibody specific for proteolipid protein (*green*) and another specific for an epitope common to proteolipid protein and its spliced variant, DM20 (*red*). Staining patterns indicate targeting of DM20 to the plasma membrane of oligodendrocyte perikarya and processes (*red*) and to compact myelin (*yellow*). In contrast, PLP appears to be targeted only to compact myelin (*yellow*). See related article in this issue by Trapp et al. 459–468.
