In Brief
Angiostatin antagonizes angiomitin.
Endostatin antagonizes itself, trimerized.
Integrins to the rescue.
HMG1 and atherosclerosis.
W.A. Wells

Comment
F35 Hold that line: Angiomotin regulates endothelial cell motility.

Contents continued

Cover picture: Interaction of the urokinase plasminogen activator receptor (uPAR) with vitronectin (VN) induces reorganization of the actin cytoskeleton. The cover pictures show the effect on the actin cytoskeleton of ectopic expression of human uPAR in growing Swiss 3T3 murine fibroblasts plated in serum-free medium on fibronectin (FN; top) or VN (bottom). Multiple protrusions with strong lamellipodial activity at the edge are induced in cells on VN, but not in cells on FN. For further details see the article in this issue by Kjöller and Hall (pp. 1145–1157).
